

Fortinet

Exam Questions NSE7_EFW-7.2

Fortinet NSE 7 - Enterprise Firewall 7.2

NEW QUESTION 1

Which two statements about the Security fabric are true? (Choose two.)

- A. FortiGate uses the FortiTelemetry protocol to communicate with FortiAnalyzer.
- B. Only the root FortiGate sends logs to FortiAnalyzer
- C. Only FortiGate devices with configuration-sync receive and synchronize global CMDB objects that the toot FortiGate sends
- D. Only the root FortiGate collects network topology information and forwards it to FortiAnalyzer

Answer: BC

Explanation:

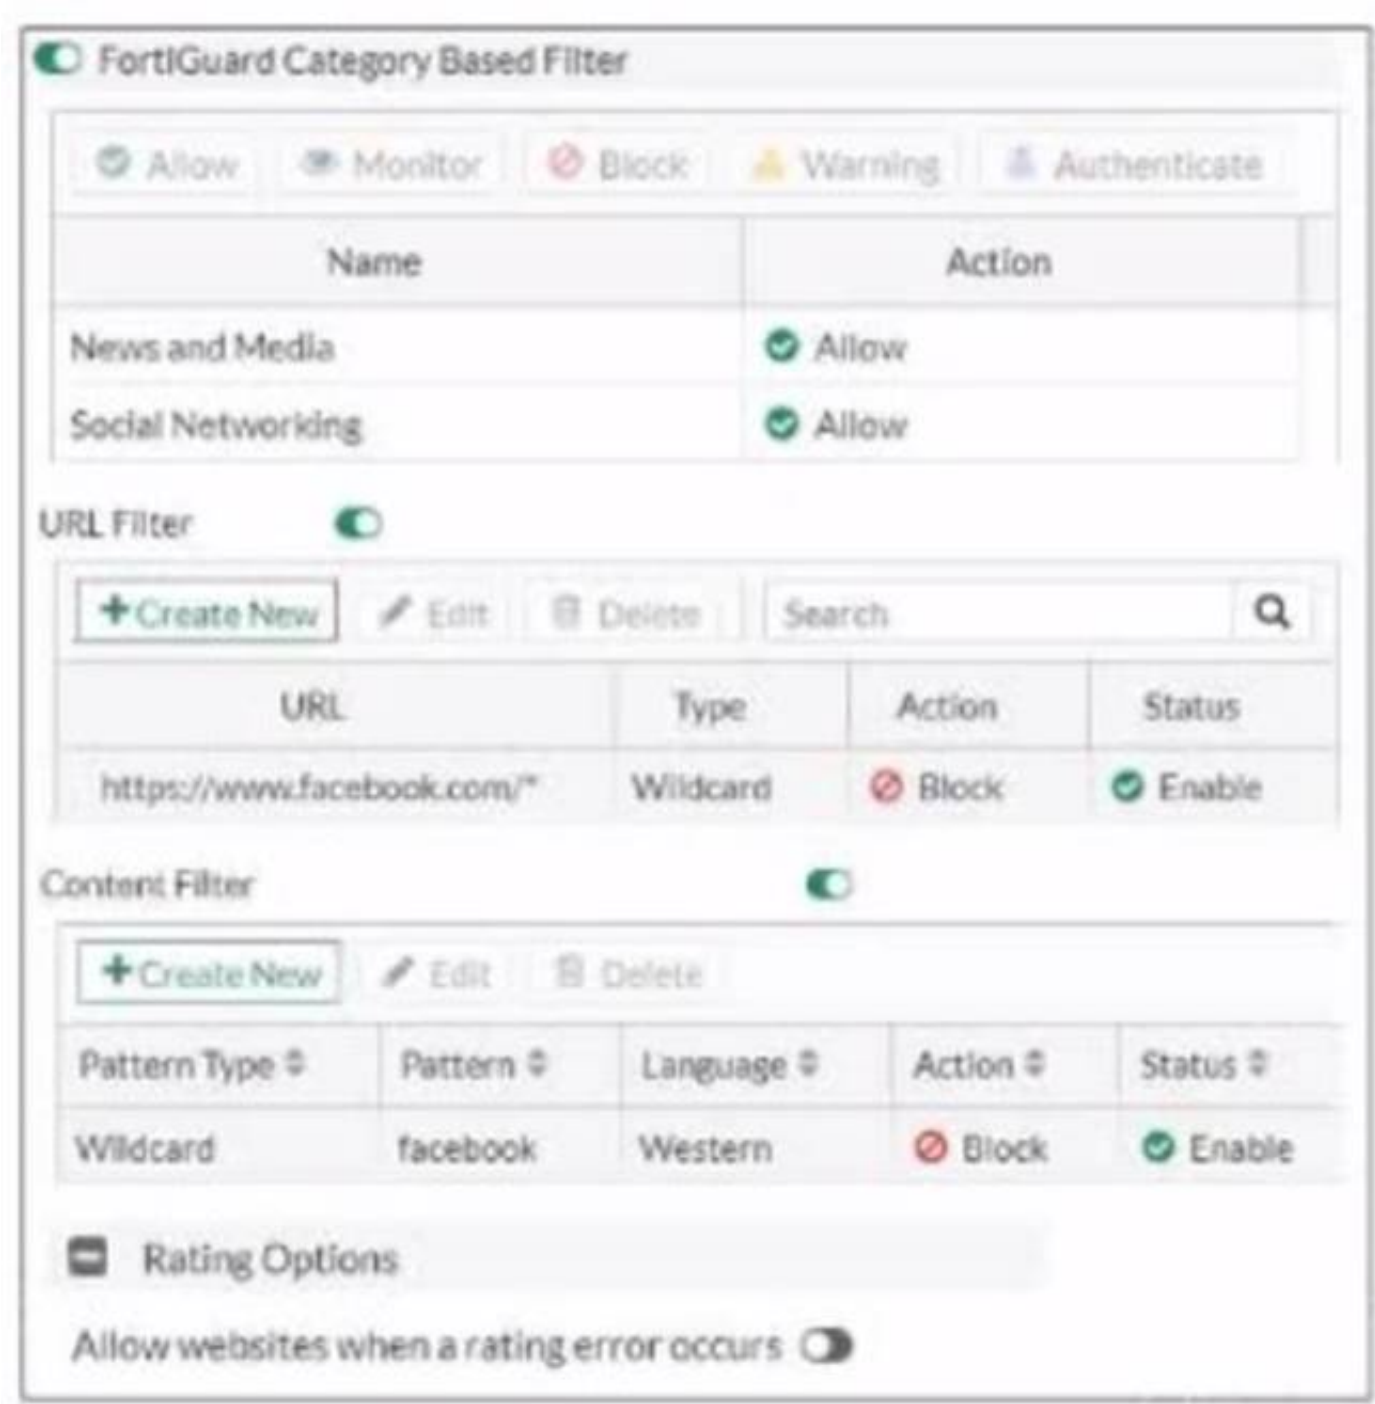

In the Security Fabric, only the root FortiGate sends logs to FortiAnalyzer (B). Additionally, only FortiGate devices withconfiguration-syncenabled receive and synchronize global Central Management Database (CMDB) objects that the root FortiGate sends (C). FortiGate uses the FortiTelemetry protocol to communicate with other FortiGates, not FortiAnalyzer (A). The last option (D) is incorrect as all FortiGates can collect and forward network topology information to FortiAnalyzer.

References:

? FortiOS Handbook - Security Fabric

NEW QUESTION 2

Exhibit.

Refer to the exhibit, which shows a partial web filter profile conjuration

What can you cone udo from this configuration about access towwww.facebook, com, which is categorized as Social Networking?

- A. The access is blocked based on the Content Filter configuration
- B. The access is allowed based on the FortiGuard Category Based Filter configuration
- C. The access is blocked based on the URL Filter configuration
- D. The access is hocked if the local or the public FortiGuard server does not reply

Answer: C

Explanation:

The access to www.facebook.com is blocked based on the URL Filter configuration. In the exhibit, it shows that the URL “www.facebook.com” is specifically set to “Block” under the URL Filter section1. References := Fortigate: How to configure Web Filter function on Fortigate, Web filter | FortiGate / FortiOS 7.0.2 | Fortinet Document

Library, FortiGate HTTPS web URL filtering ... - Fortinet ... - Fortinet Community

NEW QUESTION 3

Refer to the exhibits, which show the configurations of two address objects from the same FortiGate.

Engineering address object

Name	Engineering
Color	 <input type="button" value="Change"/>
Type	Subnet
IP/Netmask	192.168.0.0 255.255.255.0
Interface	<input type="checkbox"/> any
Static route configuration	<input type="checkbox"/>
Comments	<input type="text" value="Write a comment..."/> 0/255
<input type="button" value="OK"/> <input type="button" value="Cancel"/>	

Finance address object

Name	Finance
Color	 <input type="button" value="Change"/>
Type	Subnet
IP/Netmask	192.168.1.0 255.255.255.0
Interface	<input type="checkbox"/> any
Static route configuration	<input type="checkbox"/>
Comments	<input type="text" value="Write a comment..."/> 0/255
<input type="button" value="Return"/>	

Why can you modify the Engineering address object, but not the Finance address object?

- A. You have read-only access.
- B. FortiGate joined the Security Fabric and the Finance address object was configured on the root FortiGate.
- C. FortiGate is registered on FortiManager.
- D. Another user is editing the Finance address object in workspace mode.

Answer: B

Explanation:

The inability to modify the Finance address object while being able to modify the Engineering address object suggests that the Finance object is being managed by a higher authority in the Security Fabric, likely the root FortiGate. When a FortiGate is part of a Security Fabric, address objects and other configurations may be managed centrally.

This aligns with the Fortinet FortiGate documentation on Security Fabric and central management of address objects.

NEW QUESTION 4

Which two statements about IKE version 2 fragmentation are true? (Choose two.)

- A. Only some IKE version 2 packets are considered fragmentable.
- B. The reassembly timeout default value is 30 seconds.
- C. It is performed at the IP layer.
- D. The maximum number of IKE version 2 fragments is 128.

Answer: AD

Explanation:

In IKE version 2, not all packets are fragmentable. Only certain messages within the IKE negotiation process can be fragmented. Additionally, there is a limit to the number of fragments that IKE version 2 can handle, which is 128. This is specified in the Fortinet documentation and ensures that the IKE negotiation process can proceed even in networks that have issues with large packets. The reassembly timeout and the layer at which fragmentation occurs are not specified in this context within Fortinet documentation.

NEW QUESTION 5

Which ADVPN configuration must be configured using a script on fortiManager, when using VPN Manager to manage fortiGate VPN tunnels?

- A. Enable AD-VPN in IPsec phase 1
- B. Disable add-route on hub
- C. Configure IP addresses on IPsec virtual interlaces
- D. Set protected network to all

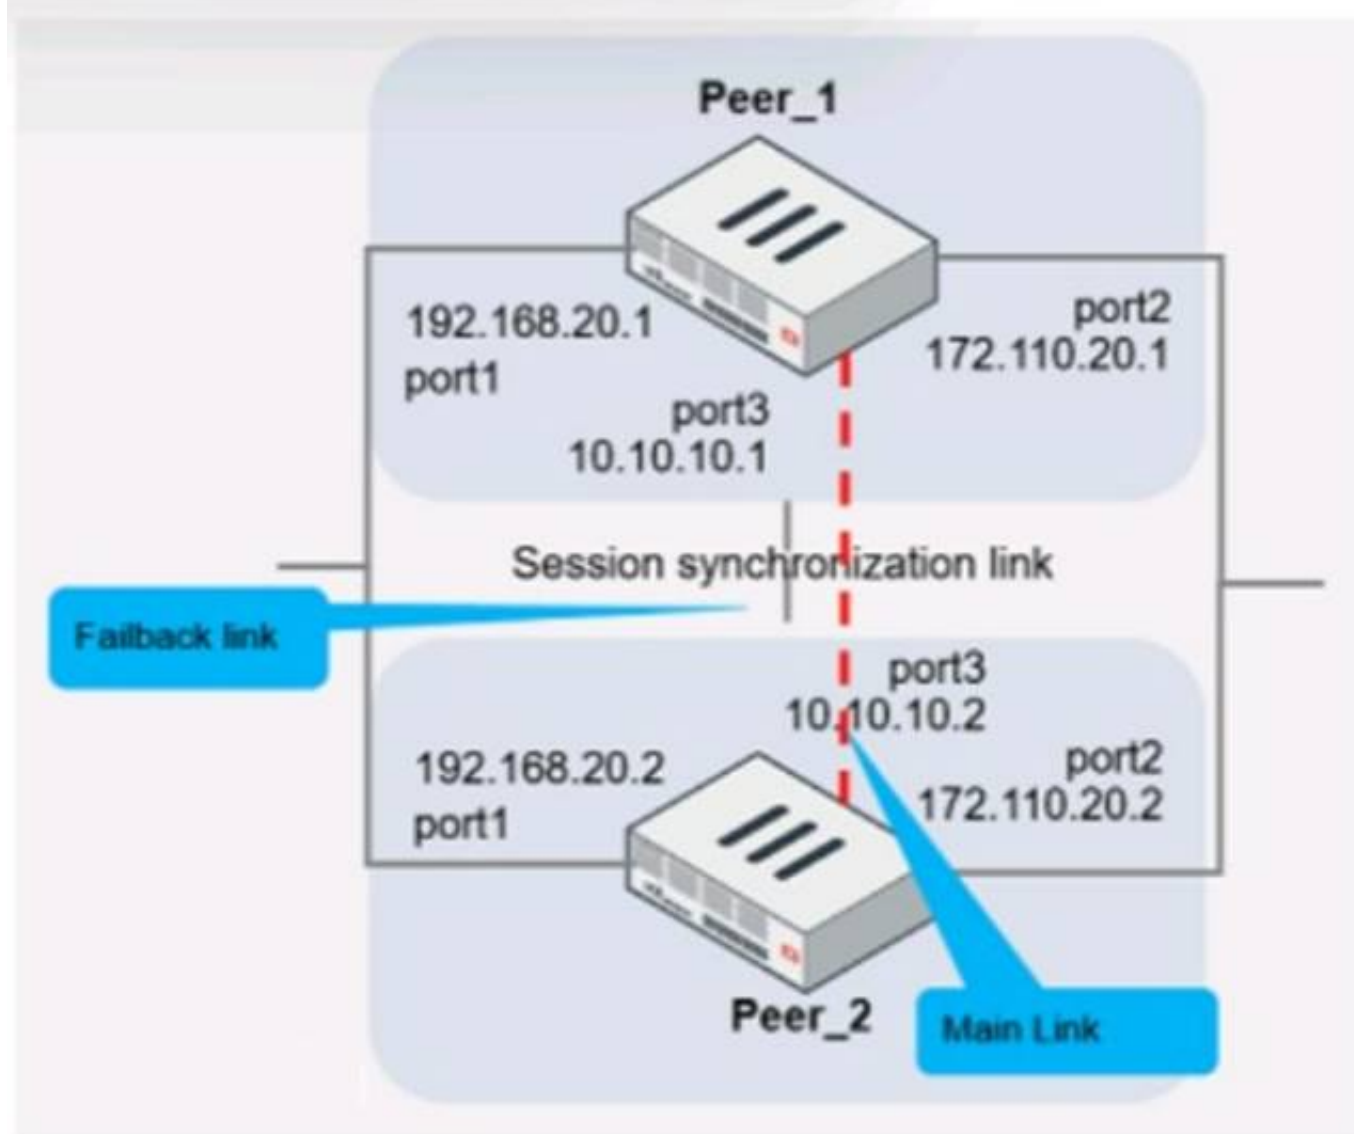

Answer: A

Explanation:

To enable AD-VPN, you need to edit an SD-WAN overlay template and enable the Auto-Discovery VPN toggle. This will automatically add the required settings to the IPsec template and the BGP template. You cannot enable AD-VPN directly in the IPsec phase 1 settings using VPN Manager. References := ADVPN | FortiManager 7.2.0 - Fortinet Documentation

NEW QUESTION 6

Refer to the exhibit, which shows two configured FortiGate devices and peering over FGSP.

The main link directly connects the two FortiGate devices and is configured using the set session-syn-dev <interface> command.

What is the primary reason to configure the main link?

- A. To have both sessions and configuration synchronization in layer 2
- B. To load balance both sessions and configuration synchronization between layer 2 and 3
- C. To have only configuration synchronization in layer 3
- D. To have both sessions and configuration synchronization in layer 3

Answer: D

Explanation:

The primary purpose of configuring a main link between the devices is to synchronize session information so that if one unit fails, the other can continue processing traffic without dropping active sessions.

* A.To have both sessions and configuration synchronization in layer 2.This is incorrect because FGSP is used for session synchronization, not configuration synchronization. B.To load balance both sessions and configuration synchronization between layer 2 and 3.FGSP does not perform load balancing and is not used for configuration synchronization.

* C.To have only configuration synchronization in layer 3.The main link is not used solely for configuration synchronization.

* D.To have both sessions and configuration synchronization in layer 3.The main link in an FGSP setup is indeed used to synchronize session information across the devices, and it operates at layer 3 since it uses IP addresses to establish the peering.

NEW QUESTION 7

Refer to the exhibit.

```
config system global
  set admin-https-pki-required disable
  set av-failopen pass
  set check-protocol-header loose
  set memory-use-threshold-extreme 95
  set strict-dirty-session-check enable
  ...
end
```

which contains a partial configuration of the global system. What can you conclude from this output?

- A. NPs and CPs are enabled
- B. Only CPs are disabled
- C. Only NPs are disabled
- D. NPs and CPs are disabled

Answer: D

Explanation:

The configuration output shows various global settings for a FortiGate device. The terms NP (Network Processor) and CP (Content Processor) relate to FortiGate's hardware acceleration features. However, the provided configuration output does not directly mention the status (enabled or disabled) of NPs and CPs. Typically, the command to disable or enable hardware acceleration features would specifically mention NP or CP in the command syntax. Therefore, based on the output provided, we cannot conclusively determine the status of NPs and CPs, hence option D is the closest answer since the output does not confirm that they are enabled.

References:

? FortiOS Handbook - CLI Reference for FortiOS 5.2

NEW QUESTION 8

Which two statements about metadata variables are true? (Choose two.)

- A. You create them on FortiGate
- B. They apply only to non-firewall objects.
- C. The metadata format is \$<metadata_variable_name>.
- D. They can be used as variables in scripts

Answer: AD

Explanation:

Metadata variables in FortiGate are created to store metadata associated with different FortiGate features. These variables can be used in various configurations and scripts to dynamically replace the variable with its actual value during processing. A: You create metadata variables on FortiGate. They are used to store metadata for FortiGate features and can be called upon in different configurations. D: They can be used as variables in scripts. Metadata variables are utilized within the scripts to dynamically insert values as per the context when the script runs.

Fortinet FortiOS Handbook: CLI Reference

NEW QUESTION 9

Refer to the exhibit, which shows the output of a BGP summary.

```
FGT # get router info bgp summary
BGP router identifier 0.0.0.117, local AS number 65117
BGP table version is 104
3 BGP AS-PATH entries
0 BGP community entries

Neighbor      V    AS      MsgRcvd MsgSent   TblVer   InQ OutQ   Up/Down   State/PfxRcd
10.125.0.60    4  65060    1698    1756     103      0    0    03:02:49      1
10.127.0.75    4  65075    2206    2250     102      0    0    02:45:55      1
100.64.3.1     4  65501     101     115      0       0    0    never        Active

Total number of neighbors 3
```

What two conclusions can you draw from this BGP summary? (Choose two.)

- A. External BGP (EBGP) exchanges routing information.
- B. The BGP session with peer 10. 127. 0. 75 is established.
- C. The router 100. 64. 3. 1 has the parameter bfd set to enable.
- D. The neighbors displayed are linked to a local router with the neighbor-range set to a value of 4.

Answer: AB

Explanation:

The output of the BGP (Border Gateway Protocol) summary shows details about the BGP neighbors of a router, their Autonomous System (AS) numbers, the state of the BGP session, and other metrics like messages received and sent.

From the BGP summary provided:

* A.External BGP (EBGP) exchanges routing information.This conclusion can be inferred because the AS numbers for the neighbors are different from the local AS number (65117), which suggests that these are external connections.

- * B.The BGP session with peer 10.127.0.75 is established.This is indicated by the state/prefix received column showing a numeric value (1), which typically means that the session is established and a number of prefixes has been received.
- * C.The router 100.64.3.1 has the parameter bfd set to enable.This cannot be concluded directly from the summary without additional context or commands specifically showing BFD (Bidirectional Forwarding Detection) configuration.
- * D.The neighbors displayed are linked to a local router with the neighbor-range set to a value of 4.The neighbor-range concept does not apply here; the value 4 in the 'V' column stands for the BGP version number, which is typically 4.

NEW QUESTION 10

Refer to the exhibit, which shows a routing table.

Network ID	Gateway IP ID	Interfaces ID	Distance ID	Type ID
0.0.0.0	10.10.254	port1	10	Static
10.10.0/24	0.0.0.0	port1	0	Connected
10.14.0/24	10.10.100	port1	110	OSPF
10.110.0/24	0.0.0.0	port2	0	Connected
172.16.100.0/24	0.0.0.0	port3	0	Connected

What two options can you configure in OSPF to block the advertisement of the 10.1.10.0 prefix? (Choose two.)

- A. Remove the 16.1.10.C prefix from the OSPF network
- B. Configure a distribute-list-out
- C. Configure a route-map out
- D. Disable Redistribute Connected

Answer: BC

Explanation:

To block the advertisement of the 10.1.10.0 prefix in OSPF, you can configure a distribute-list-out or a route-map out. A distribute-list-out is used to filter outgoing routing updates from being advertised to OSPF neighbors1. A route-map out can also be used for filtering and is applied to outbound routing updates2. References := Technical Tip: Inbound route filtering in OSPF using route-maps - Fortinet Community, OSPF | FortiGate / FortiOS 7.2.2 - Fortinet Documentation

NEW QUESTION 10

Which, three conditions are required for two FortiGate devices to form an OSPF adjacency? (Choose three.)

- A. OSPF interface network types match
- B. OSPF router IDs are unique
- C. OSPF interface priority settings are unique
- D. OSPF link costs match
- E. Authentication settings match

Answer: ABE

Explanation:

- ? Option A is correct because the OSPF interface network types determine how the routers form adjacencies and exchange LSAs on a network segment. The network types must match for the routers to become neighbors1.
- ? Option B is correct because the OSPF router IDs are used to identify each router in the OSPF domain and to establish adjacencies. The router IDs must be unique for the routers to become neighbors2.
- ? Option E is correct because the authentication settings control how the routers authenticate each other before exchanging OSPF packets. The authentication settings must match for the routers to become neighbors3.
- ? Option C is incorrect because the OSPF interface priority settings are used to elect the designated router (DR) and the backup designated router (BDR) on a broadcast or non-broadcast multi-access network. The priority settings do not have to be unique for the routers to become neighbors, but they affect the DR/BDR election process4.
- ? Option D is incorrect because the OSPF link costs are used to calculate the shortest path to a destination network based on the bandwidth of the links. The link costs do not have to match for the routers to become neighbors, but they affect the routing decisions5. References: =
- ? 1: OSPF network types
- ? 2: OSPF router ID
- ? 3: OSPF authentication
- ? 4: OSPF interface priority
- ? 5: OSPF link cost

Security Profiles

Refer to the exhibit, which contains a partial policy configuration. Which setting must you configure to allow SSH?

- A. Specify SSH in the Service field
- B. Configure port 22 in the Protocol Options field.
- C. Include SSH in the Application field
- D. Select an application control profile corresponding to SSH in the Security Profiles section

Answer: A

Explanation:

? Option A is correct because to allow SSH, you need to specify SSH in the Service field of the policy configuration. This is because the Service field determines which types of traffic are allowed by the policy1. By default, the Service field is set to App Default, which means that the policy will use the default ports defined by the applications. However, SSH is not one of the default applications, so you need to specify it manually or create a custom service for it2.

? Option B is incorrect because configuring port 22 in the Protocol Options field is not enough to allow SSH. The Protocol Options field allows you to customize the protocol inspection and anomaly protection settings for the policy3. However, this field does not override the Service field, which still needs to match the traffic type.

? Option C is incorrect because including SSH in the Application field is not enough to allow SSH. The Application field allows you to filter the traffic based on the application signatures and categories4. However, this field does not override the Service field, which still needs to match the traffic type.

? Option D is incorrect because selecting an application control profile corresponding to SSH in the Security Profiles section is not enough to allow SSH. The Security Profiles section allows you to apply various security features to the traffic, such as antivirus, web filtering, IPS, etc. However, this section does not override the Service field, which still needs to match the traffic type. ? 4: Application control

NEW QUESTION 16

In which two ways does fortiManager function when it is deployed as a local FDS? (Choose two)

- A. It can be configured as an update server a rating server or both
- B. It provides VM license validation services
- C. It supports rating requests from non-FortiGate devices.
- D. It caches available firmware updates for unmanaged devices

Answer: AB

Explanation:

When deployed as a local FortiGuard Distribution Server (FDS), FortiManager functions in several capacities. It can act as an update server, a rating server, or both, providing firmware updates and FortiGuard database updates. Additionally, it plays a crucial role in VM license validation services, ensuring that the connected FortiGate devices are operating with valid licenses. However, it does not support rating requests from non-FortiGate devices nor cache firmware updates for unmanaged devices. Fortinet FortiOS Handbook: FortiManager as a Local FDS Configuration

NEW QUESTION 18

Refer to the exhibit, which shows an ADVPN network.

Which VPN phase 1 parameters must you configure on the hub for the ADVPN feature to function? (Choose two.)

- A. set auto-discovery-forwarder enable
- B. set add-route enable
- C. set auto-discovery-receiver enable
- D. set auto-discovery-sender enable

Answer: AC

Explanation:

For the ADVPN feature to function properly on the hub, the following phase 1 parameters must be configured:
 * A. set auto-discovery-forwarder enable: This enables the hub to forward shortcut information to the spokes, which is essential for them to establish direct tunnels.
 * C. set auto-discovery-receiver enable: This allows the hub to receive shortcut offers from the spokes.
 This information is corroborated by the Fortinet documentation, which explains that in an ADVPN setup, the hub must be able to both forward and receive shortcut information for dynamic tunnel creation between spokes.

NEW QUESTION 21

Exhibit.

Script Name	Static Route
Comments	<div>0/255</div> <div>0/255</div>
Type	CLI Script
Run script on	Remote FortiGate Directly (...)
Script details	<pre># conf rout stat # edit 0 # set gateway 10.20.121.2 # set priority 20 # set device "wan1" # next # end</pre>

Refer to the exhibit, which contains a CLI script configuration on FortiManager. An administrator configured the CLI script on FortiManager but the script failed to apply any changes to the managed

device after being executed.

What are two reasons why the script did not make any changes to the managed device? (Choose two)

- A. The commands that start with the # sign did not run.
- B. Incomplete commands can cause CLI scripts to fail.
- C. Static routes can be added using only TCI scripts.
- D. CLI scripts must start with #!.

Answer: AB

Explanation:

The commands that start with the # sign did not run because they are treated as comments in the CLI script. Incomplete commands can cause CLI scripts to fail because they are not recognized by the FortiGate device. The other options are incorrect because static routes can be added using CLI or GUI, and CLI scripts do not need to start with #!. References := Configuring custom scripts | FortiManager 7.2.0 - Fortinet Documentation, section "CLI script syntax".

NEW QUESTION 24

Refer to the exhibit, which contains a partial OSPF configuration.

```
config router ospf
  set router-id 0.0.0.3
  set restart-mode graceful-restart
  set restart-period 30
  set restart-on-topology-change enable
  . . .
end
```

What can you conclude from this output?

- A. Neighbors maintain communication with the restarting router.
- B. The router sends grace LSAs before it restarts.
- C. FortiGate restarts if the topology changes.
- D. The restarting router sends gratuitous ARP for 30 seconds.

Answer: B

Explanation:

From the partial OSPF (Open Shortest Path First) configuration output:

* B. The router sends grace LSAs before it restarts: This is implied by the command 'set restart-mode graceful-restart'. When OSPF is configured with graceful restart, the router sends grace LSAs (Link State Advertisements) to inform its neighbors that it is restarting, allowing for a seamless transition without recalculating routes.

Fortinet documentation on OSPF configuration clearly states that enabling graceful restart mode allows the router to maintain its adjacencies and routes during a brief restart period.

NEW QUESTION 25

You want to improve reliability over a lossy IPSec tunnel.

Which combination of IPSec phase 1 parameters should you configure?

- A. fec-ingress and fec-egress
- B. Odpd and dpd-retryinterval
- C. fragmentation and fragmentation-mtu
- D. keepalive and keylive

Answer: C

Explanation:

For improving reliability over a lossy IPSec tunnel, the fragmentation and fragmentation-mtu parameters should be configured. In scenarios where there might be issues with packet size or an unreliable network, setting the IPsec phase 1 to allow for fragmentation will enable large packets to be broken down, preventing them from being dropped due to size or poor network quality. The fragmentation-mtu specifies the size of the fragments. This is aligned with Fortinet's recommendations for handling IPsec VPN over networks with potential packet loss or size limitations.

NEW QUESTION 30

An administrator has configured two FortiGate devices for an HA cluster. While testing HA failover, the administrator notices that some of the switches in the network continue to send traffic to the former primary device. What can the administrator do to fix this problem?

- A. Verify that the speed and duplex settings match between the FortiGate interfaces and the connected switch ports
- B. Configure set link-failed-signal enable under config system ha on both cluster members
- C. Configure remote link monitoring to detect an issue in the forwarding path
- D. Configure set send-garp-on-failover enable under config system ha on both cluster members

Answer: B

Explanation:

Virtual MAC Address and Failover

- The new primary broadcasts Gratuitous ARP packets to notify the network that each virtual MAC is now reachable through a different switch port.

- Some high-end switches might not clear their MAC table correctly after a failover - Solution: Force former primary to shut down all its interfaces for one second

when the failover happens (excluding heartbeat and reserved management interfaces):
#Config system ha
set link-failed-signal enable end
- This simulates a link failure that clears the related entries from MAC table of the switches.
